

## Environmental policy ABB Sweden

The environmental policy for ABB Sweden is entirely based on the ABB Group's undertaking about strengthening the environmental management within nine areas and continuously improve the results the company has achieved during the last decade;

1. Conducting our operations in an environmentally sound manner by applying environmental management systems, such as ISO 14001, in all our operations and by applying environmental principles, such as commitment to continual improvement, prevention of pollutions, legal compliance and awareness training of employees, in all our operations worldwide.
2. Promoting environmental responsibility along the value chain by encouraging suppliers, sub-contractors and customers to adopt international environmental standards.
3. Developing our manufacturing processes with focus on energy and resource efficiency.
4. Conducting regular audits of our facilities' environmental performance and in connection with acquisitions, divestments and mergers.
5. Transferring eco-efficient technologies to developing countries.
6. Developing and marketing products and systems which are resource efficient and facilitate use of renewable energy sources.
7. Declaring environmental performance of our core products by publishing environmental product declarations based on life-cycle assessment.
8. Including environmental aspects in the risk assessment of major customer projects.
9. Ensuring transparency by producing an annual Sustainability report, based on GRI requirements and which is independently verified.
